Prior to jQuery 1.4.3, `.data(obj)` completely replaced all data. Since jQuery 1.4.3, data is instead extended by shallow merge. Since jQuery 3, every two-character sequence of "-" (U+002D) followed by a lowercase ASCII letter in a key is replaced by the uppercase version of the letter, in alignment with the HTML dataset API.

.data() | jQuery API Documentation

When a number is passed as the value, jQuery will convert it to a string and add px to the end of that string. If the property requires units other than px, convert the value to a string and add the appropriate units before calling the method. When using .css() as a setter, jQuery modifies the element's style property.

The success callback function is passed the returned data, which will be an XML root element or a text string depending on the MIME type of the response. It is also passed the text status of the response. As of jQuery 1.5, the success callback function is also passed a "jqXHR" object (in jQuery 1.4, it was passed the XMLHttpRequest object).. Most implementations will specify a success handler:

In jq, all filters have an input and an output, so manual plumbing is not necessary to pass a value from one part of a program to the next. Many expressions, for instance `a + b`, pass their input to two distinct subexpressions (here `a` and `b` are both passed the same input), so variables aren't usually necessary in order to use a value twice.

Where the DataTables API departs from jQuery's chaining method is that DataTables makes use of nested methods and properties. For example the `ajax.json()` method gives you access to the latest JSON data from an Ajax call DataTables has made - in this case the `json()` method is a child of the `ajax` property.
