In fact, studies have shown that the degree of nonlinear longitudinal instability and chaos can be correlated qualitatively with the regularity of cellular pattern observed in multidimensional settings, i.e. that closer or below the 1D stability limit the cellular structure is more regular or vice-versa [18,27,28].

In the article, the methods of investigating the instability that were formulated earlier by the authors are systematized in the form of a set of criteria for the instability and chaos. The latest ones are used to study chaotic dynamics in the problems of Sprott and the nonlinear electronic generator of the CRC.

Overall dynamics of the intermittent control model heavily depend on dynamics of the on-subsystem. Since the on-subsystem, if it were persistently activated, is identical with the continuous control model, dynamics (including stability) of the on-subsystem can be characterized by the stability map shown in Fig. 1.
