Momentum as a Vector Quantity. Momentum is a vector quantity.As discussed in an earlier unit, a vector quantity is a quantity that is fully described by both magnitude and direction. To fully describe the momentum of a 5-kg bowling ball moving westward at 2 m/s, you must include information about both the magnitude and the direction of the bowling ball.

Your book may be teaching physics in what may be called the "plug-and-chug" approach. This is where you are always given the numbers, you plug the numbers into the basic equations, then manipulate those equations with the specific numbers, rather than the general quantities ##m\_1, m\_2, v\_1, v\_2## etc.

Answer: E. When a car skids to a stop, the work done by friction upon the car is equal to the change in kinetic energy of the car. Work is directly proportional to the displacement of the car (skidding distance) and the kinetic energy is directly related to the square of the speed ( $KE=0.5*m*v^2$ ).For this reason, the skidding distance is directly proportional to the square of the speed.

The hard way to solve this problem is to do it the way that many students think is the easy way — "numbers in, answers out" or "plug and chug". This method appears easy since it requires little thought, but it turns out to be quite demanding. First, convert to SI units.

If you figure out how to solve the problem with variables first, you can always go back and plug numbers in. If you solve exclusively with numbers, you are increasing your chances of bugging something up if you plug and chug it in a calculator. Remember, numbers are inaccurate, variables are exact.

It's usually plug and chug where you take  $f(g(4))$  and run it through both functions. This leads to the idea of creating a composite function  $f(g(x))$ . But it's somewhat academic, and it's not like you're saving time b/c you need to run 50 different numbers through both functions.

And would you apply that problem approach prior to becoming a physics expert, did they teach that in kindergarten? Eg in school we learn as kids derivatives, rote routines to solve a type of problem, and we plug and chug, but we are not shown (necessarily) by govt education the underlying theories that may create a solution.
